For deployment you have to pass `_tokentobeused` in the contructor this will be the Es token address.

For calling `NewEscrow(address sellerAddress, uint amount, bytes32 notes)`
First approve the amount from the user wallet to the Escrow SC address

For calling `TokenTimelock()`
This is for curator staking you have to approve 10000 ES from the user address to Escrow SC address

In the Escrow SC 0 is buyer and 1 is seller

To release any Escrow fund ID is required, this ID is generated while calling NewEscrow()
